

***Neisseria* (*Meningitis; gonorrhoea; respiratory infections*)**

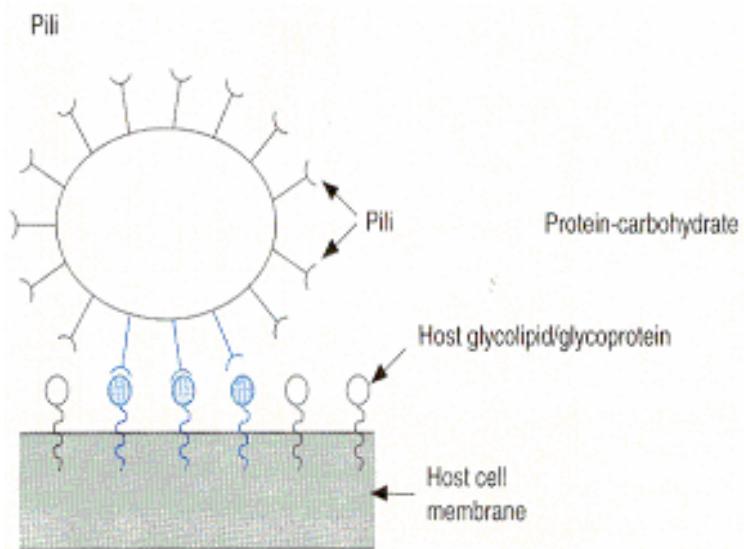

*Neisseria*spp. Em photo magnification unknown

***Neisseria* spp**

- *N. gonorrhoeae* → gonococcus
- *N. meningitidis* → meningococcus
- Location:

Fimbriae

***Neisseria* spp. growth requirements**

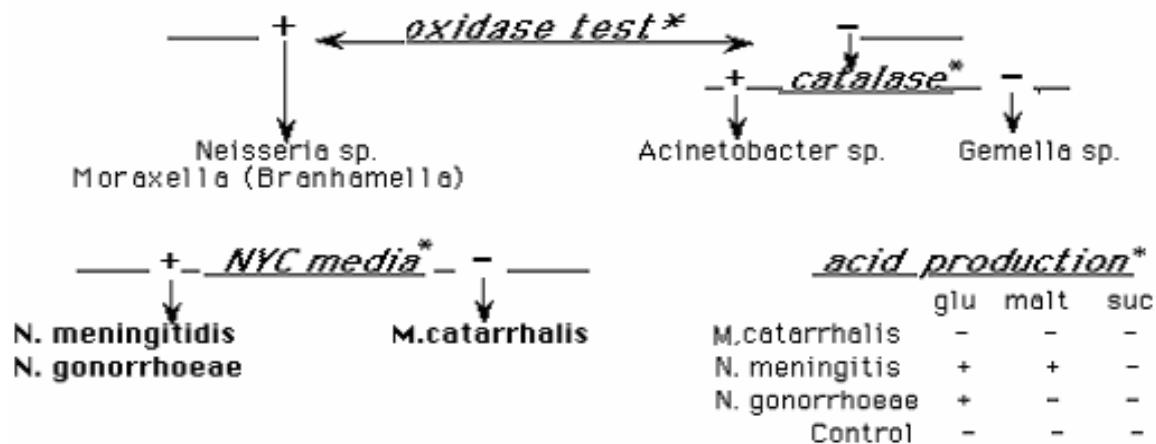

- Exacting
- 35-36 °C
- 5-10% carbon dioxide

Other indicative tests

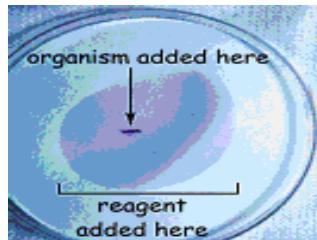

- Oxidase test
- Carbohydrate utilization
- <http://www.cat.cc.md.us/courses/bio141/labmanual/lab16/ctang.html>

Identification of Gram Negative Aerobic Cocci

Neisseria/ Moraxella/ Acinetobacter

Oxidase Test

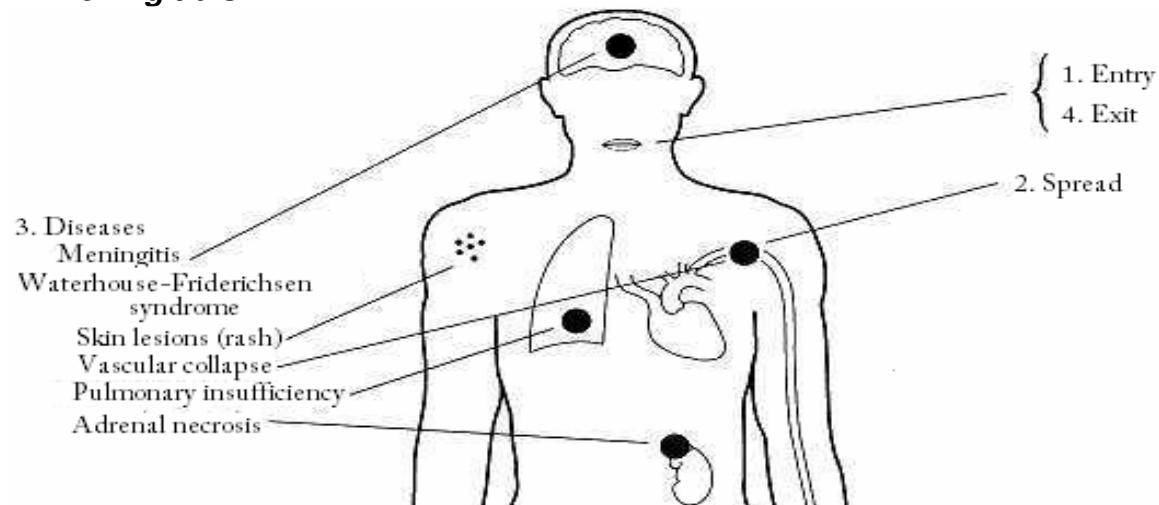

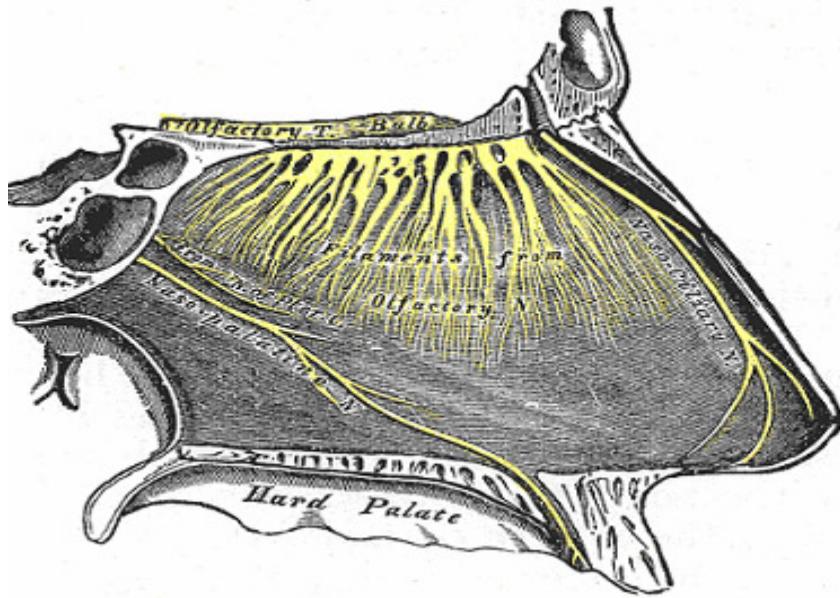

- Kovac's oxidase reagent is added to a colony.

Positive Result:

- purple/black colour reaction, indicating oxidation of the reagent

N. meningitidis

Route

Nerves of the
septum of the nose.
Right side(Gray's
Anatomy)

- Through the sheaths of the olfactory nerve
- Nasopharyngeal mucosa

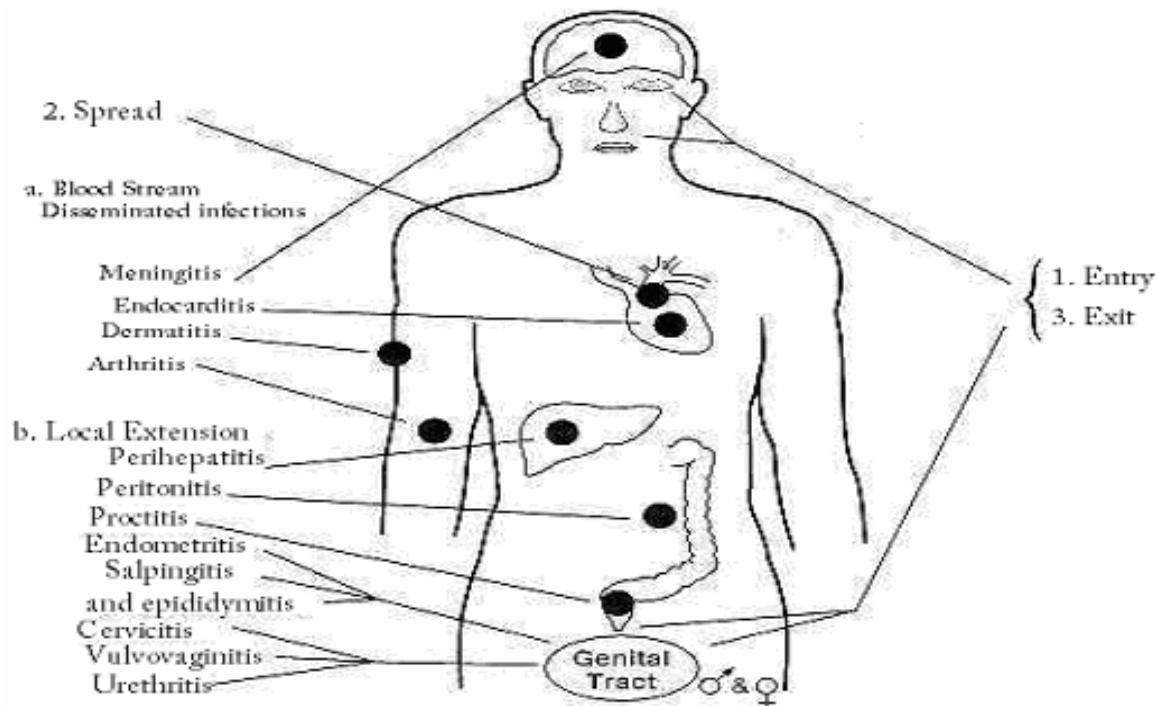

purpuric rash

[www.meningitis.org/ sect3/subsect2](http://www.meningitis.org/sect3/subsect2)

Epidemiology

- Worldwide
- Notifiable
- Winter, northern hemisphere

N. gonorrhoeae *gonos(seed) andrhoia(flow)*

***N. gonorrhoeae* Pathogenesis**

- Exclusively a human pathogen
- Never found as a normal commensal
- Infected, though asymptomatic
→ Later disease development

Disease:

LOCALIZED
DISSEMINATED
